- Footprints
- GGUS
- Request Tracker

The screenshot displays the BEST PRACTICAL ticketing system interface. At the top, it shows the company logo and navigation links for 'Preferences' and 'Logout', with the user logged in as 'sales'. The main header includes 'RT for example.com', a 'New ticket in' button, a dropdown menu set to 'Customer Service', and a search box. The left sidebar contains navigation options: 'Home', 'Tickets' (with sub-links for Search and New Search), '#6 Display' (with sub-links for History, Basics, Dates, People, Links, and Jumbo), 'RTFM', 'Configuration', 'Preferences', and 'Approval'. The main content area shows the details for ticket #6, titled '#6: Contact at Cunningham & Sherry'. It includes sections for 'The Basics' (Id: 6, Status: open, Worked: 0 min, Priority: 0/0, Queue: Sales), 'Dates' (Created: Fri Aug 01 15:18:25 2003, Starts: Not set, Started: Not set, Last Contact: Fri Aug 01 15:54:22 2003, Due: Not set, Closed: Not set, Updated: Fri Aug 01 15:54:21 2003 by sales2), 'Custom Fields' (Foo: no value), 'People' (Owner: sales2, Requestors: nobody@bestpractical.com, Cc: , AdminCc:), and 'Relationships' (Depends on: , Depended on by: , Parents: , Children: , Refers to: , Referred to by:). Below these is a 'History' section with a table of events: a ticket created by sales at 15:18:26, taken by sales2 at 15:54:00, status changed to open by RT_System at 15:54:20, and correspondence added by sales2 at 15:54:20. The correspondence includes a message from Rick: 'I will give them a call this afternoon. -Rick'. The interface also shows 'Display mode: [Brief headers] [Full headers]' and a footer with version information: 'RT 3.0.5pre2 from Best Practical Solutions, LLC.'

Fix before users notice?

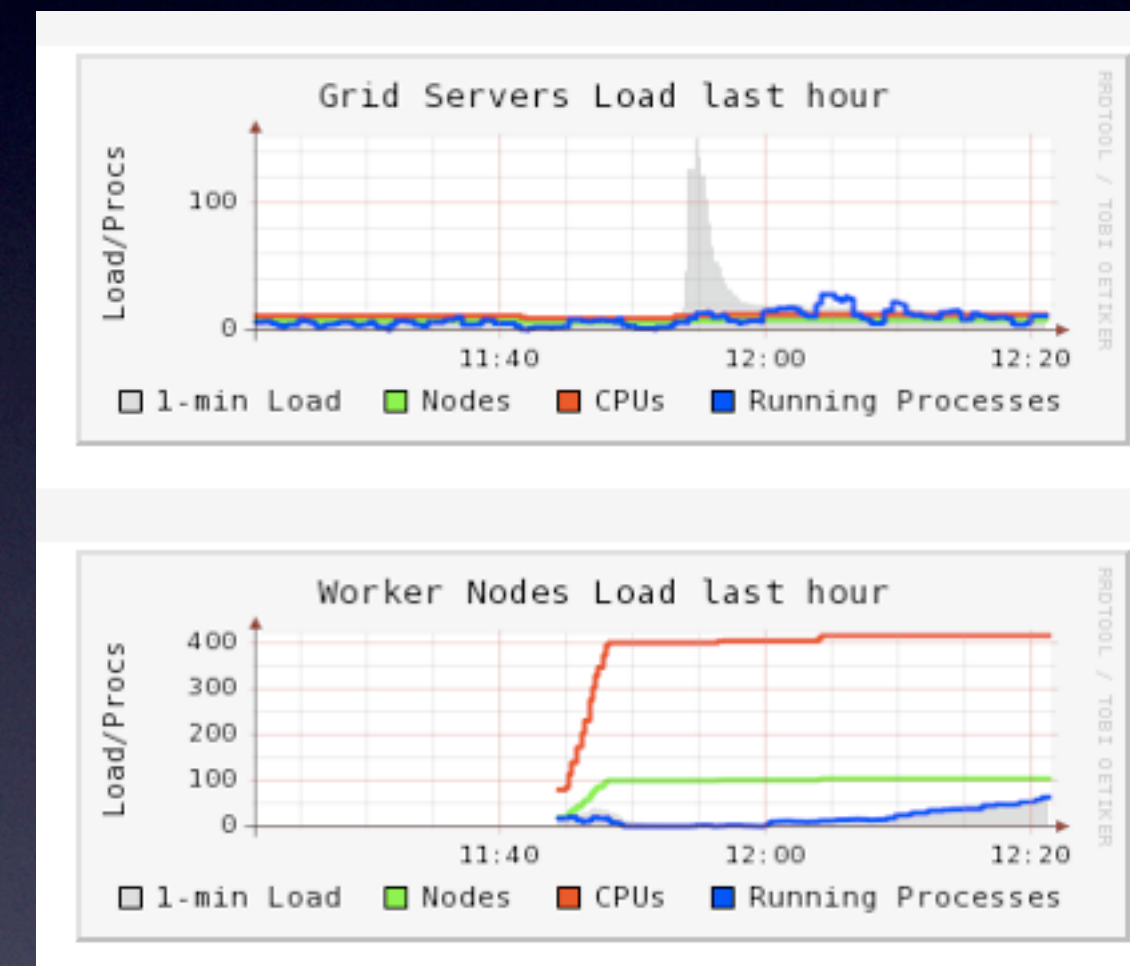

The screenshot displays the Best Practical ticketing system interface. At the top, it shows the company logo and navigation links like 'Preferences' and 'Logout'. Below this is a search bar and a dropdown menu for 'Customer Service'. The main content area is titled '#6: Contact at Cunningham & Sherry' and includes a sidebar with navigation options like 'Tickets', 'Search', and 'History'. The ticket details are organized into sections: 'The Basics' (Id: 6, Status: open, Priority: 0/0), 'Dates' (Created: Fri Aug 01 15:18:25 2003, Last Contact: Fri Aug 01 15:54:22 2003), 'Custom Fields' (Foo: no value), 'People' (Owner: sales2, Requestors: nobody@bestpractical.com), and 'Relationships'. A 'History' section at the bottom shows a list of events, including 'Ticket created', 'Status changed from new to open', and 'Correspondence added'. The interface is clean and professional, typical of enterprise-level ticketing systems.

Trend Monitoring

- X disk free - is that up or down?
- Temperature - What's normal?
- Network activity - have you been slashdotted?

Ganglia

- Most cluster vendors package it.
- <http://ganglia.sf.net>

Ganglia

- Most cluster vendors package it.
- <http://ganglia.sf.net>
- Can be fed from MonAMI...

‘Something Broke’

- Various companies sell products that can monitor boxes / network / programs
- eg, Tivoli, NetView
- Nagios may not be ‘The Best’ - but it’s free, good enough and contributed to by the HEP community.

Espresso Maker

- Nuff Said.

What is Nagios?

- “An Open Source host, service and network monitoring program”
- Central Daemon
 - intermittently polls hosts and services
 - uses plugins
 - returns the status information
 - Notifies / escalates depending on severity / pattern

Nagios Overview

- <http://www.nagios.org>
- Ethan Galstad released under GPL2
- Version 2.10 (stable) and 3.0beta5
- Needs Linux and C compiler
- Web GUI - Apache and libgd
- Can also monitor Windows (NSClient) and Netware

Screenshots

The screenshot displays the Nagios web interface. At the top, the browser address bar shows the URL <https://svr031.gla.scotgrid.ac.uk/nagios/>. The interface is divided into several sections:

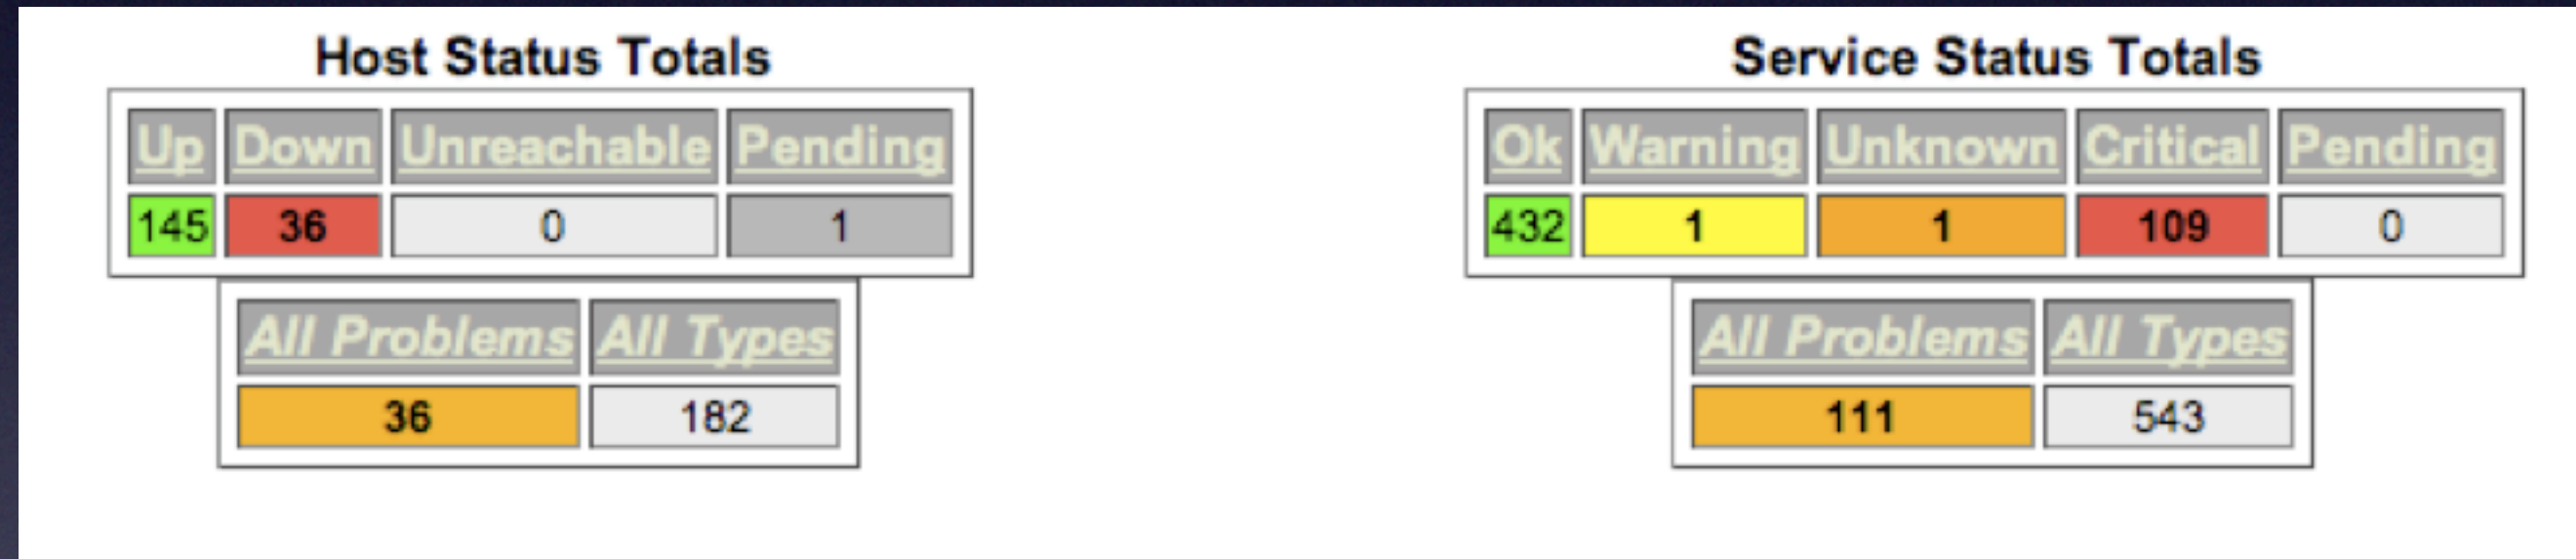

- Current Network Status:** Last Updated: Mon Oct 29 23:09:54 GMT 2007. Updated every 90 seconds. Nagios® - www.nagios.org. Logged in as /C=UK/O=eScience/OU=Glasgow/L=CompServ/CN=andrew.elwell.
- Host Status Totals:** A summary table showing 145 Up, 36 Down, 0 Unreachable, and 1 Pending hosts.
- Service Status Totals:** A summary table showing 432 OK, 1 Warning, 1 Unknown, 109 Critical, and 0 Pending services.
- Display Filters:** Host Status Types: All; Host Properties: Any; Service Status Types: All Problems; Service Properties: Any.
- Service Status Details For All Hosts:** A table listing the status of various services across multiple hosts.

Host	Service	Status	Last Check	Duration	Attempt	Status Information

Screenshots

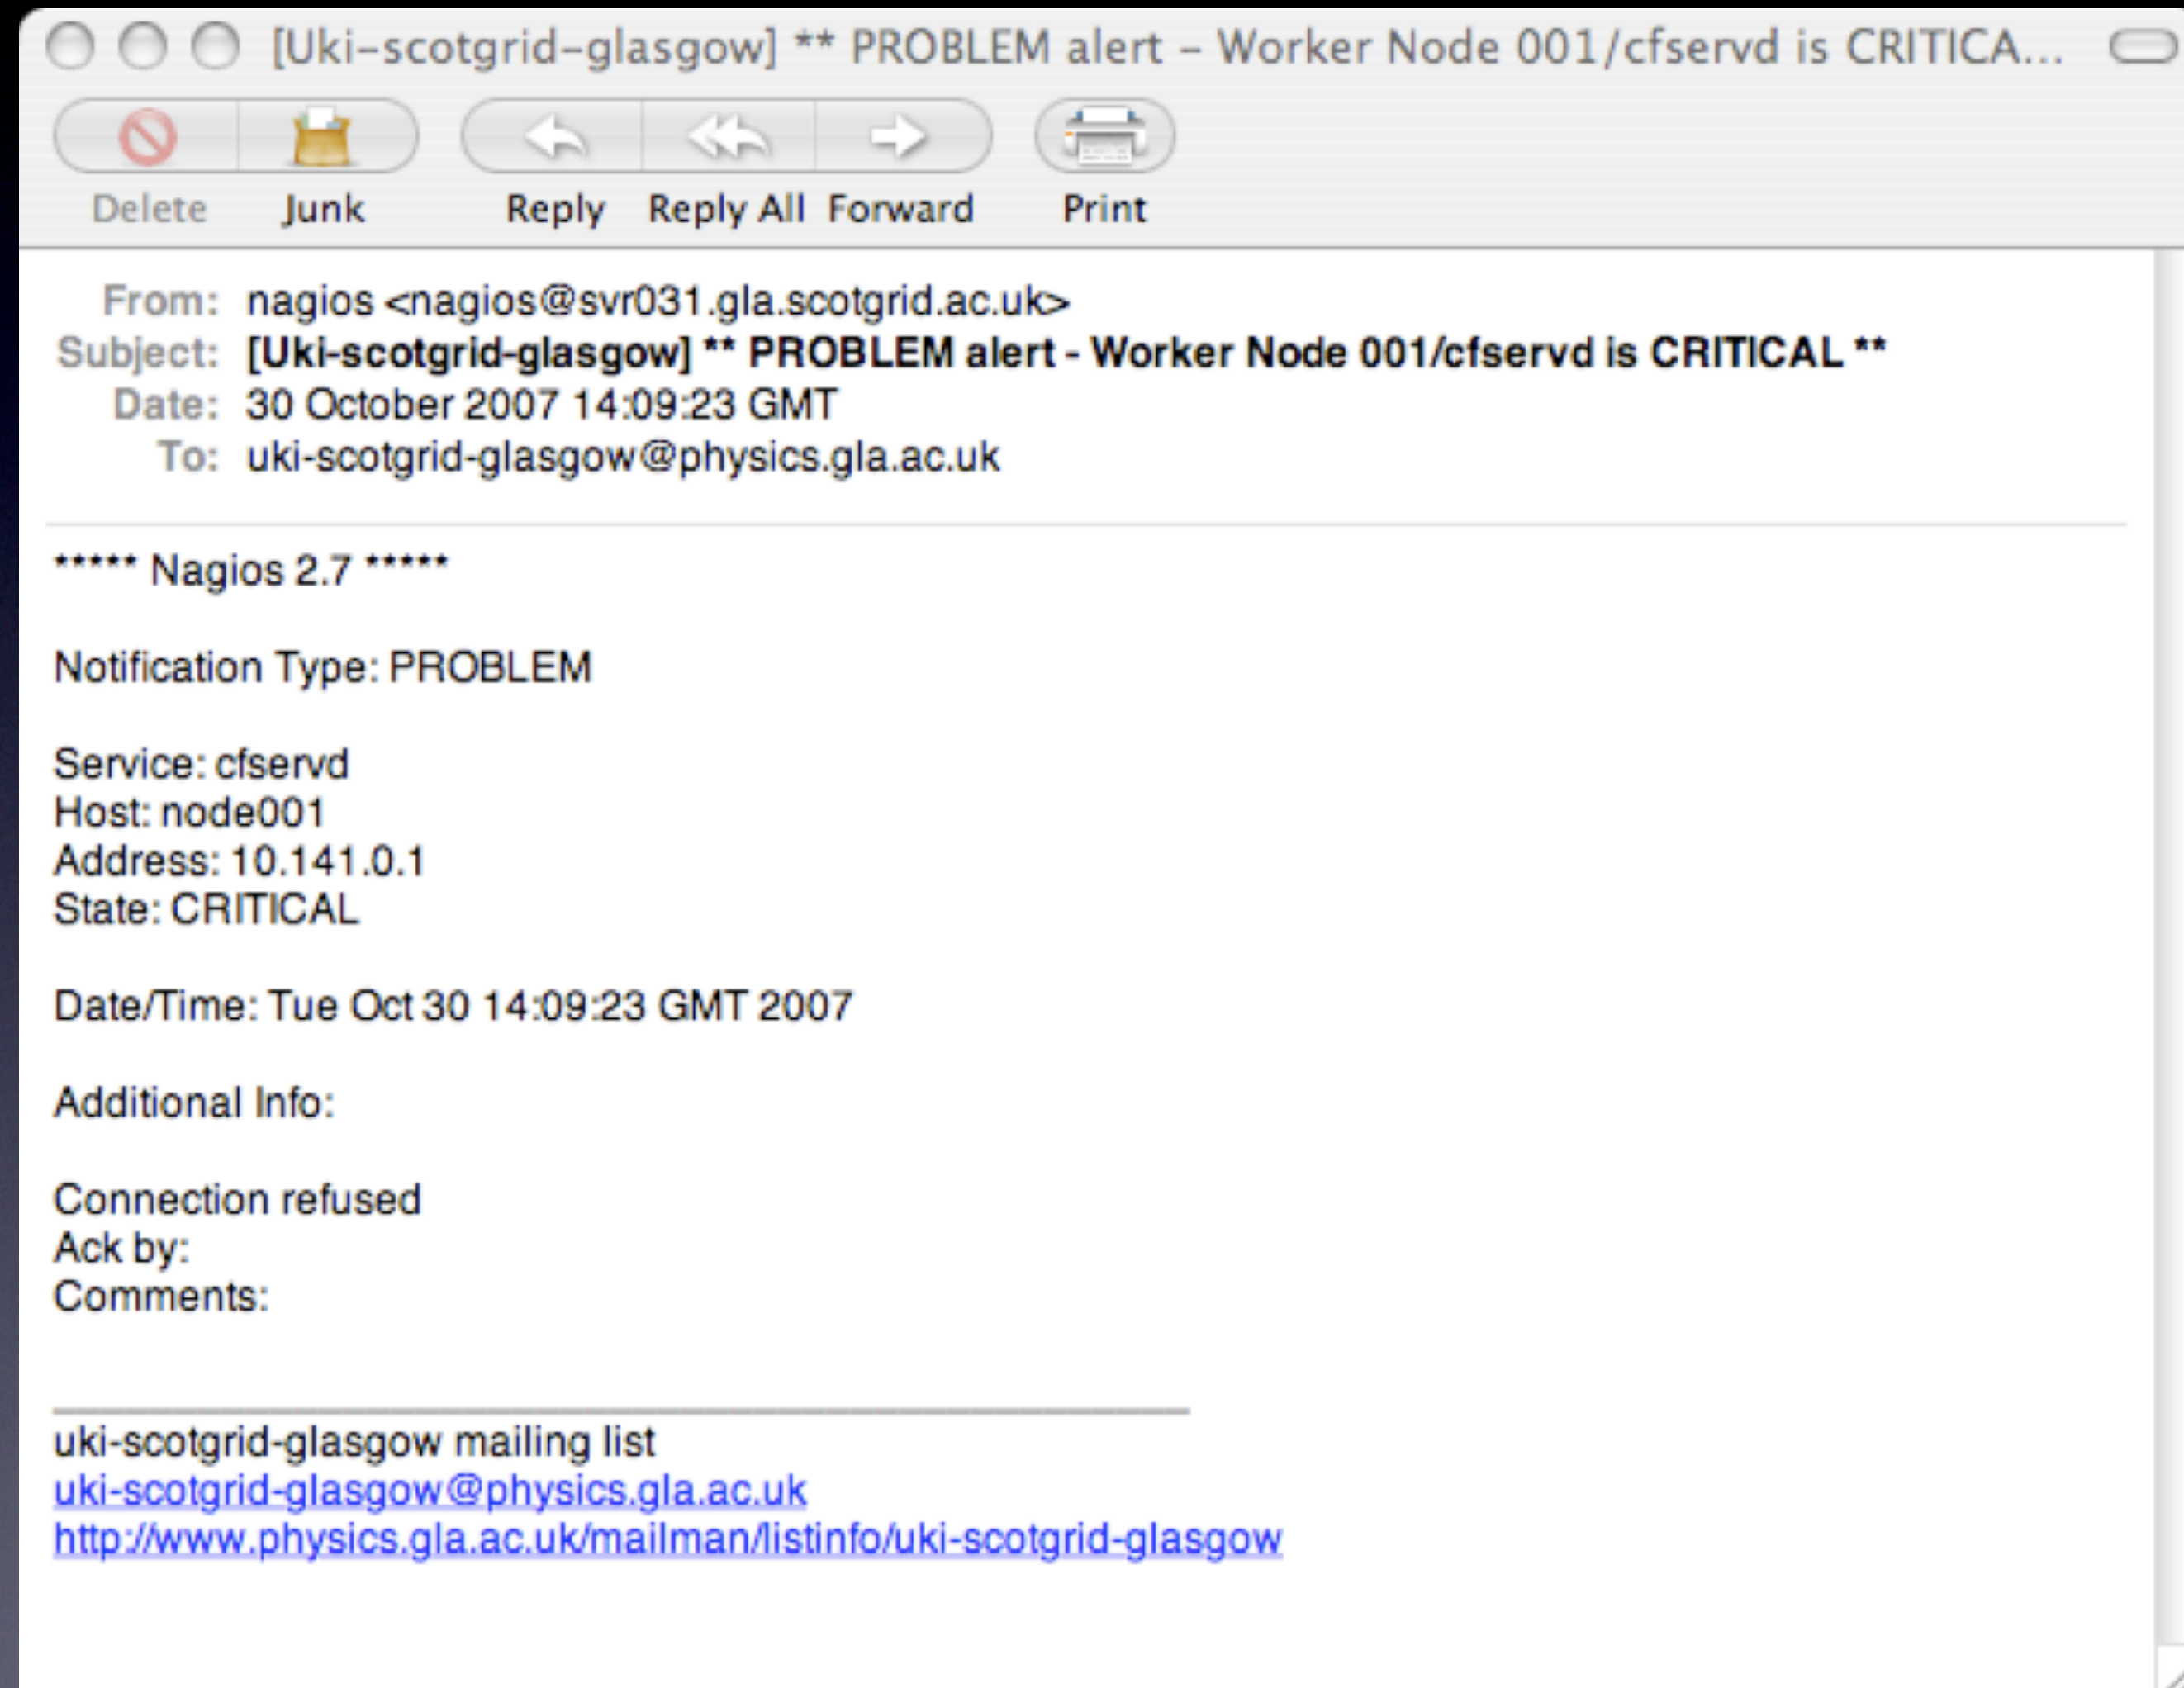

Screenshots

Installation

- Choose a SECURE box to host it on that can see the network
- Source from nagios.org
- RPMs from DAG
 - nagios, nagios-plugins, nagios-plugins-nrpe, nagios-nsca
- .deb already in ubuntu (2.9)

Configuration

- Start monitoring localhost until you get the basics
- Add in a new `cfg_dir=` into `nagios.cfg`
- Expand to ping test of your nodes
- Add a few network accessible services (sshd)
- Run probes on remote boxes

Config Tips

- `check_period 24*7` even if notifications aren't
- Leave authentication up to Apache - use `*` in `cgi.cfg`
- See the 'Time Saving Tricks for Object Definitions' regexps and multiple hosts

Templates

```
cat <<EOF > $CFG
# Nagios config file for gla.scotgrid worker nodes
# built automatically from genhost.sh

define hostgroup{
    alias          Worker Nodes
    hostgroup_name workernodes
}

define host{
    name wn_template
    use linux-server
    hostgroups workernodes
    register 0
}

define service{
    hostgroup_name workernodes
    service_description sshd
    check_command check_ssh
    servicegroups sshservers
    use local-service
}
EOF
```

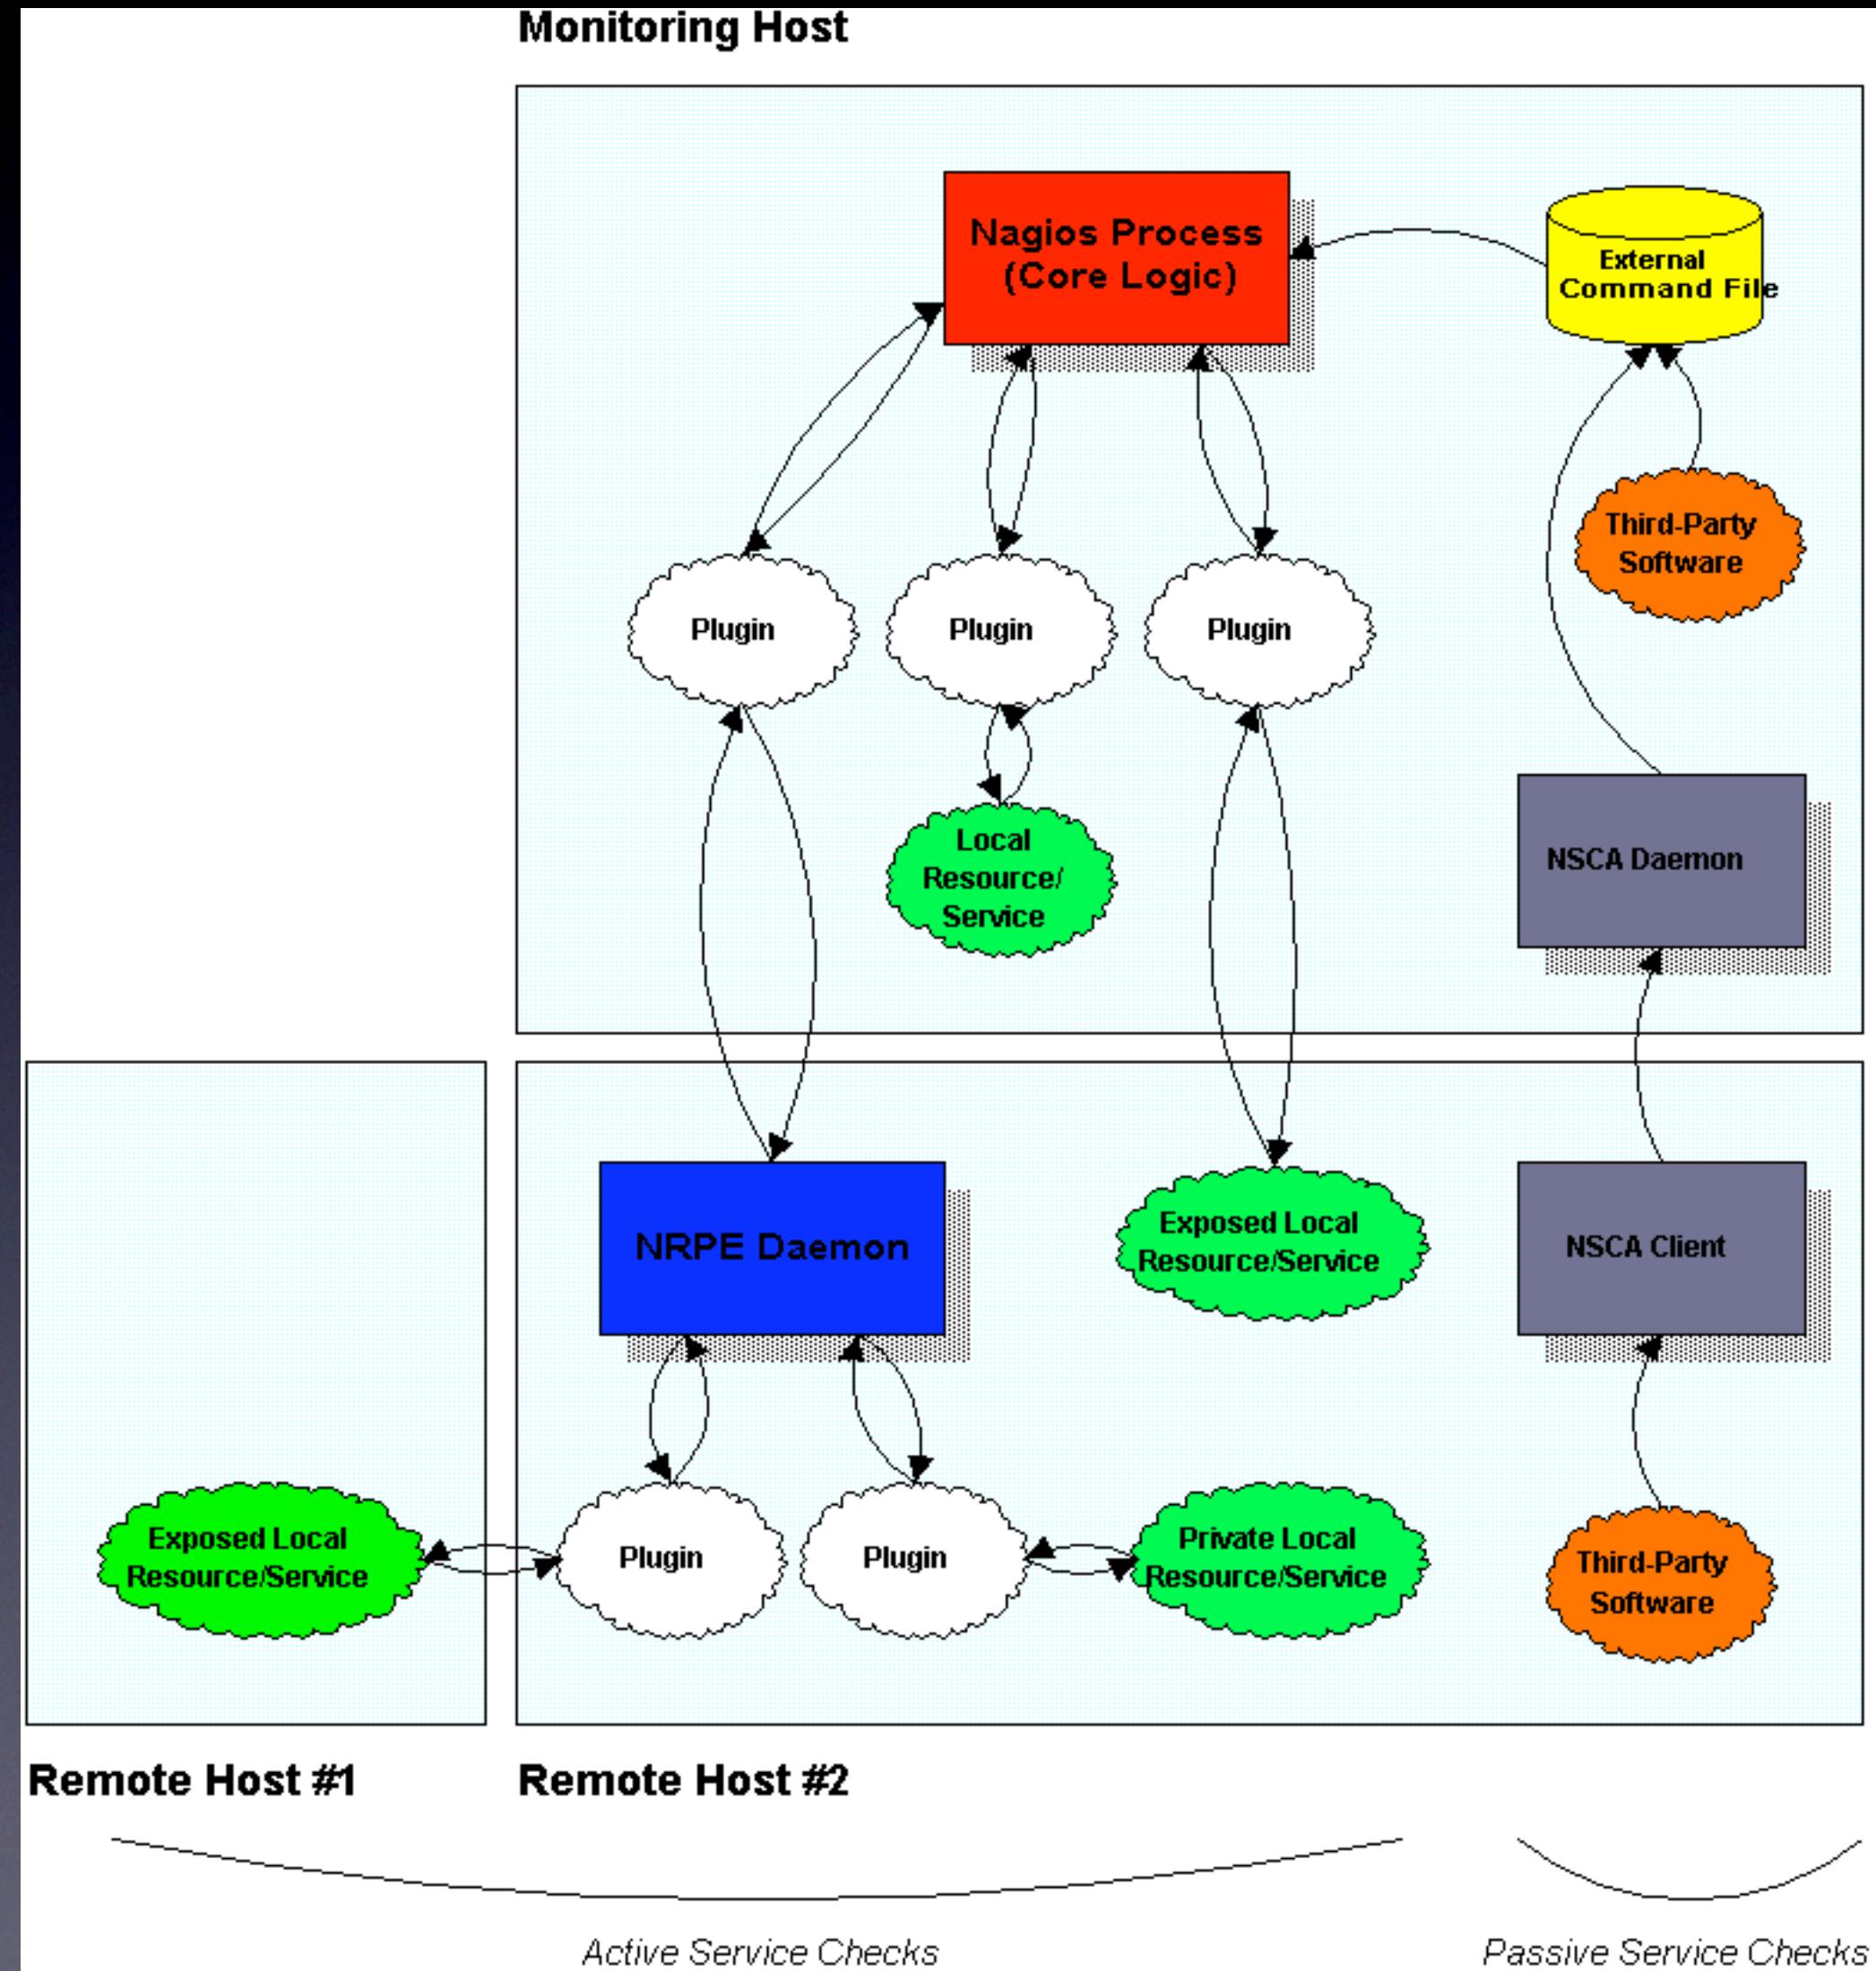

```
for i in `seq 1 140` ; do
h=`printf "%03d" $i`
cat <<EOF >> $CFG
define host {
    host_name node$h
    alias Worker Node $h
    address 10.141.0.$i
    use wn_template
}

EOF
done
```

Plugins

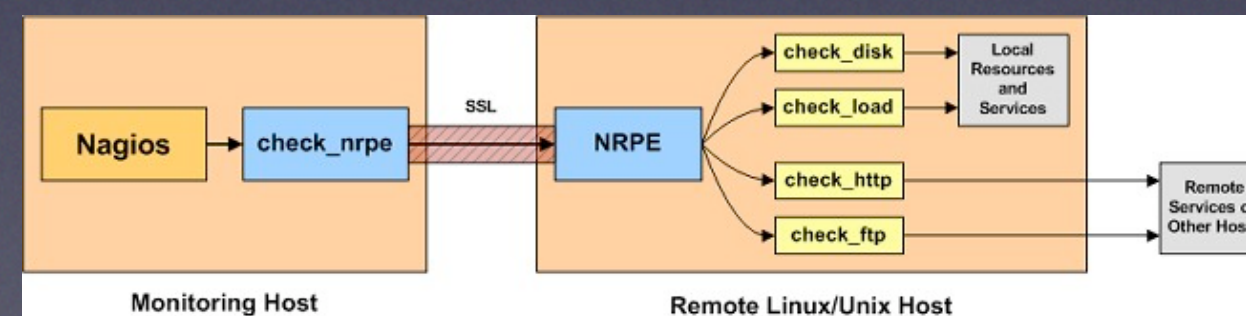

- Can be written in any language - exit code counts
- 0 - OK, 1 - Warning, 2 - Critical, 3 - Unknown
- <http://nagiosplug.sf.net/developer-guidelines.html>
- Plenty of included ones in the rpms
- Beware of overhead (switch to C / embPerl)

Active / Passive

NRPE

- Daemon runs on remote host (5666/tcp)
- Accepts SSL from check_nrpe
- Runs *previously defined* plugins on that host
- You need to install plugins on remote host...

NSCA

- Daemon runs on the nagios server
- Client spits output with send_nsca script
- Need to configure nagios to accept the passive checks
- `<host_name>[tab]<svc_description>[tab]<return_code>[tab]<plugin_output>`
`[newline]`
- `<host_name>[tab]<return_code>[tab]<plugin_output>[newline]`

NSCA

- Daemon runs on the nagios server
- Client spits output with send_nsca script
- Need to configure nagios to accept the passive checks
- `<host_name>[tab]<svc_description>[tab]<return_code>[tab]<plugin_output>`
`[newline]`
- `<host_name>[tab]<return_code>[tab]<plugin_output>[newline]`
- Yep, it works with MonAMI

Jabber / SMS

- Perl script that uses Net::XMPP
- Presently hacky as hard-coded @gmail.com address
- Edited contacts.cfg to include

```
...  
pager andrew.elwell  
service_notification_commands notify-by-jabber  
host_notification_commands host-notify-by-jabber  
service_notification_period 24x7  
host_notification_period 24x7  
...
```

Escalation

- Yep. Good Idea. We don't use it.

Event Handlers

- Attempts to fix critical services
- Log trouble tickets etc
- No, We don't use it...

Scheduled Maintenance

- stop nagios (blind)
- put node into maintenance using web page (single host)
- echo into the nagios pipe (scalable)

```
#!/bin/bash
# This is a sample shell script showing how you can submit the
# SCHEDULE_HOST_DOWNTIME command
# to Nagios. Adjust variables to fit your environment as necessary.

now=`date +%s`
minuslh=$(( $now - 3600 ))
pluslh=$(( $now + 3600 ))
commandfile='/var/log/nagios/rw/nagios.cmd'
for i in `seq 109 138 140` ; do
    /usr/bin/printf "[%lu] SCHEDULE_HOST_DOWNTIME;node$i;%lu;%lu;0;0;604800;
SysAdmins;Down to reduce power\n" \
        $now $minuslh $pluslh > $commandfile
done
```

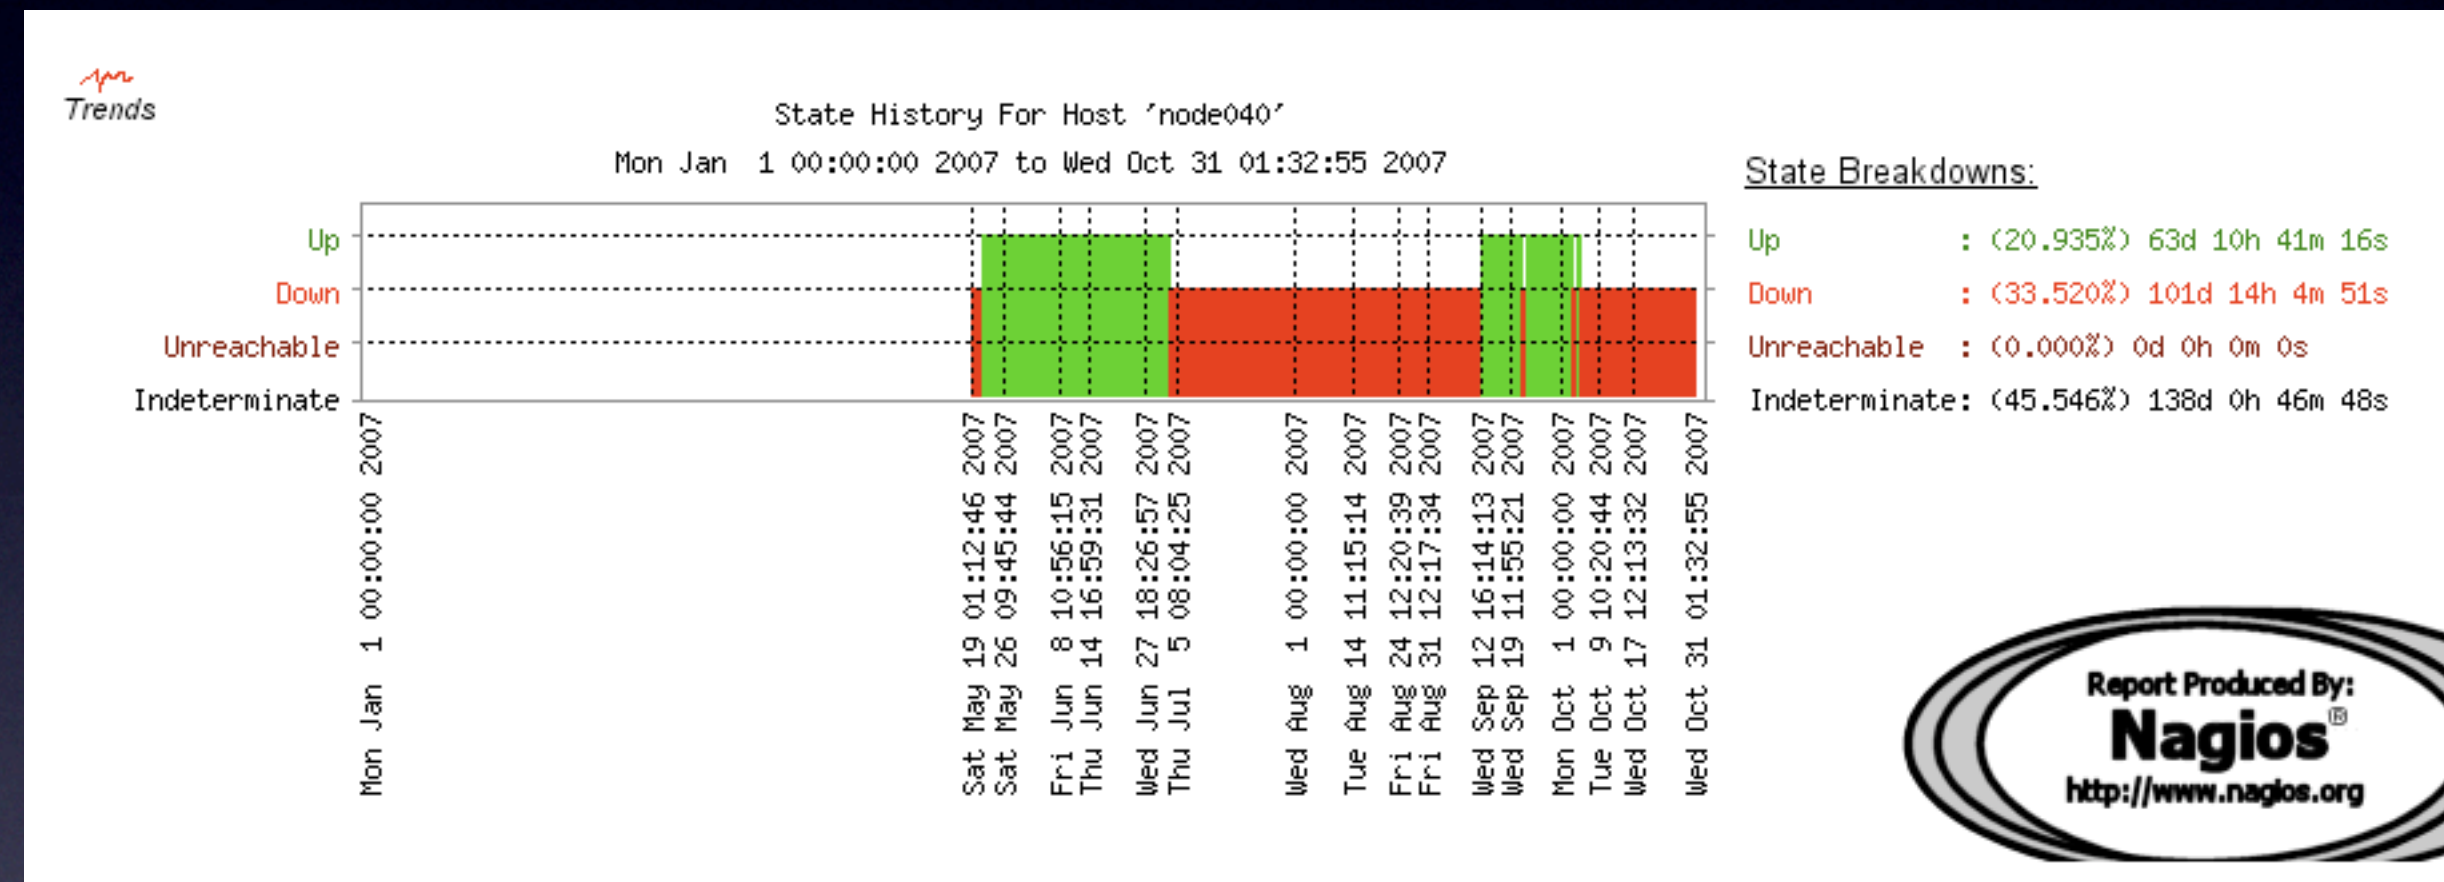

Dependencies

- DOWN
- UNREACHABLE

```
define host{  
    host_name      Switch2  
    parents        Router1  
}
```

Availability Reporting

More Info...

- Nagios Community Wiki - http://www.nagioscommunity.org/wiki/index.php/Main_Page
- Plugins <http://nagiosplugins.org/>
- Nagios Exchange <http://www.nagiosexchange.org/>
- <http://www.gridpp.ac.uk/wiki/Nagios>

snippets from 3.0 docs

- `use_large_installation_tweaks` - OS does memory cleanup, doesn't double `fork()` but no summary macros
- Multiline plugin output (from 350b to 4k)
- Docs are MUCH clearer than 2.0 ones
- Host checks run in parallel
- `check_{host|service}_cluster` for HA setups

Any Questions?
